

The Nimbus 5.0

The Nimbus 5.0 is a one-of-a-kind space travel machine. Made by the hands of NASA's finest mechanical engineers, it is the fastest and coolest machine on the planet. It is literally, out of this world. Elon Musk doesn't have a look in.

Defeating all laws of science, this space travel machine is the fastest known method of transport in the galaxy and travels just as fast as light. It is powered by the magical combination of sugarcane, human kindness and Einstein's DNA which, together, create super sonic, anti-gravity energy that chases time itself. This allows you to cross intergalactic highways as quickly as you would drive up the M1 to Belfast. Below is are instructions of how it operates:

Enter the seating pod on the machine's top side and allow the strawberry-lace latex belt to hug you tight to the chair. This is designed to keep you safe and your taste buds satisfied as you travel towards intergalactic territories.

Press the Pink Bubble button located in front of you. A bubble of pink gum will appear above your head. Don't worry - it's anti-burst gum will not burst until you land at your desired planet.

Inform the machine of your destination using the constellation map in front of you. If you want to go slow through your interplanetary journey, press the 'Scenic' button. This will allow you to enjoy the sights above and below you as you travel. Alternatively, press the Speed button if you are in a rush.

Warning: Watch out for meteor showers! If the Nimbus 5.0 detects meteors approaching, it will automatically wrap itself in a liquid titanium layer that will repel any oncoming high-speed missiles but you may experience some turbulence during this time.

Now, sit back and relax. Enjoy your sweet, super sonic journey of a lifetime!
